COURSE PROGRAM

UFOP
Universidade Federal de Ouro Preto

Course Name in English: **Functional Programming** Course Name in Portuguese: **Programação Funcional**			Code: **BCC191**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 2 class hours	Practical 2 class hours

Course Description:

Characteristics of the main programming paradigms; principles of the functional programming paradigm; main characteristics of functional programming languages: recursion, functional abstraction, higher-order functions, algebraic data types, polymorphism, type inference, strict and lazy evaluation, overloading; demonstrating the correctness of functional programs.

Course Content:

1. Introduction
2. Programming paradigms
3. Defining functions
4. Recursive functions
5. Tuples, lists, and parametric and overloading polymorphism
6. Pattern matching
7. Input and output
8. Anonymous and higher-order functions
9. Algebraic data types
10. Functors and Monads
11. Property-based testing
12. Reasoning about functional programs
13. Notions of dependent types in programming languages

COURSE PROGRAM

Course Name in English: **Software Engineering II** Course Name in Portuguese: **Engenharia de Software II**			Code: **BCC194**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

Software Development Processes. Software Requirements Engineering. Software Project Management. Software as a Service (SaaS). DevOps.

Course Content:

1. Development Processes: importance of processes for team productivity and product quality assurance; types of processes (sequential or cyclical, incremental and/or evolutionary); plan-driven processes (waterfall, spiral, Rational Unified Process); agile processes (Agile Manifesto, main characteristics, main differences between XP, Scrum and Kanban, criticisms of agile methods); Extreme Programming (historical context, principles and values, customer representative and user stories, iterations and releases, effort estimation, programming practices, project management); Scrum (historical context, development cycles, roles, artifacts, ceremonies); Kanban (historical context, product backlog, Kanban board, WIP limits)

2. Requirements Engineering: types of requirements (functional, non-functional, interface); object-oriented requirements elicitation and analysis techniques; requirements specification (behavior-driven development - BDD, user stories and test scenarios, use cases, UML use case diagrams); minimum viable product (MVP); A/B testing

3. Project Management: methods and techniques for project management based on the 10 PMI - Project Management Institute knowledge areas (scope, time, cost, quality, human resources, communications, risk, procurement, stakeholders and integration); techniques for defining the product backlog and work breakdown structure (WBS); team mobilization (processes, organization, roles and responsibilities, traceability, problem solving); effort estimation and pricing; tools for monitoring and controlling software development processes (Jira and Git)

4. Software as a Service (SaaS): introduction and historical context; basic concepts (Service-Oriented Architecture - SOA, Software as a Service, Cloud Computing); SaaS application architecture (client-server versus peer-to-peer architecture, web clients and scripting languages, communication via HTTP and URIs, representation via HTML and CSS, 3-tier architecture and horizontal scalability, Model-View-Controller - MVC architecture); SaaS application performance (responsiveness and availability, monitoring and bottleneck identification, use of caching, database queries); security: protection of customer data and the Brazilian General Data Protection Law (LGPD)

5. DevOps: version control (concepts, tools, multi-repositories versus mono-repositories); Continuous Integration - CI (motivation, concepts such as master/trunk, branches, merges, integration conflicts, gitflow); Continuous Delivery - CD (deployment, delivery, feature flags, release flags and business flags); tools for source code version control and CI/CD pipeline automation (Git)

COURSE PROGRAM

Course Name in English: **Distributed Systems** Course Name in Portuguese: **Sistemas Distribuídos**			Code: **BCC195**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

Concept of distributed systems. Architecture of distributed systems. Processes and inter-process communication. Naming service in distributed systems. Synchronization service in distributed systems. Consistency and replication service in distributed systems. Fault tolerance service in distributed systems. Distributed platforms and applications.

Course Content:

1. Introduction to distributed systems: architectures, examples, evolution, and remaining open challenges
2. Review: processes, inter-process communication, concurrent programming, and network programming
3. Concept of virtualization and introduction to virtual environments
4. Examples of distributed platforms operating in computational clouds
5. How to name and locate services in distributed environments
6. Mutual exclusion and distributed synchronization protocols
7. The consistency problem and replication protocols
8. Types of failure and protocols for fault tolerance and failure recovery
9. Examples of distributed applications (routing, ordering, graph problems, information retrieval, data mining, databases, among others)

Basic Bibliography:

Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

Transaction processing. Concurrency control. Failure recovery. Stored functions and triggers. Query optimization. Object-oriented databases. Introduction to XML. Advanced database topics.

Course Content:

1. Transaction processing: theory of transaction processing, transaction execution schedules
2. Concurrency control: theory of concurrency control, concurrency control techniques
3. Failure recovery: theory of failure recovery, failure recovery techniques
4. Stored functions and triggers: creation and use of stored functions, creation and use of triggers
5. Query optimization: algorithms for query processing and optimization, processing cost estimation
6. Object-oriented databases: theory of object-oriented databases, object definition language, object query language
7. Introduction to XML: XML syntax, XML and semi-structured data, XML and relational databases
8. Advanced database topics: data storage and indexing, spatial databases, distributed databases, text databases, non-relational databases, digital libraries, data warehouses

Basic Bibliography:

Course Description:

Introduction and basic concepts; Directed and weighted networks; Models and algorithms for generating complex networks; Degree correlations; Network robustness; Community detection; Dynamic network phenomena; Advanced topics.

Course Content:

1. Introduction and basic concepts: types of networks and applications; adjacency matrix, adjacency list, weighted networks; paths and distances, centrality measures, connectivity and transitivity
2. Directed and weighted networks: directed networks, the Web, PageRank
3. Models and algorithms for generating complex networks: random networks, small-world networks, scale-free property, Barabási-Albert model, dynamic networks
4. Degree correlations: assortativity
5. Network robustness: percolation, failures and attacks
6. Community detection: concepts and algorithms
7. Dynamic network phenomena: viral spreading and information diffusion, synchronization of coupled oscillators
8. Advanced topics

Basic Bibliography:

Course Description:

Virtualization. Cloud computing. Clusters, virtual machines, containers, and container orchestrators. Data ingestion. Data modeling, storage, and querying. Data pipeline: design, implementation, and testing.

Course Content:

1. Course presentation: syllabus, objectives, bibliography
2. Virtualization concepts and overview of the main cloud environments
3. Basic operations for installing and managing a cluster of virtual machines
4. Basic operations for installing and managing containers and their orchestrators
5. Review: basic Python concepts, the pub/sub pattern, and messaging
6. Notebooks: concept, tools, and examples of best practices
7. Data ingestion: data types, existing architectures, and supporting tools
8. Data modeling: relational, non-relational, and multidimensional
9. Data storage: data ingestion into data lakes or data lakehouses
10. Data querying: tools, examples, and operationalization
11. Data pipeline: concepts and stages that make up a data pipeline; main tools for building and managing a data pipeline on virtual clusters; data pipeline bottlenecks and how to mitigate them; data pipeline examples; design, implementation, and testing of some data pipelines

COURSE PROGRAM

Course Name in English: **Dissemination of Scientific Knowledge** Course Name in Portuguese: **Divulgação Científica**			Code: **BCC292**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 120 hours	Extension 60 hours	Theoretical 0 class hours	Practical 8 class hours

Course Description:

Science communication; concepts and practical aspects of social media; scientific reading; concepts of journalistic text production.

Course Content:

1. Introduction to Science Communication and its Social Relevance: the role of science in society and the importance of scientific communication; science communication as a tool for inclusion and access to knowledge; the impact of social media and digital media on the dissemination of science

2. Communication Strategies and Dialogicity in Science Communication: techniques for making scientific content accessible to different audiences; interaction with the community to identify relevant topics; language and content adaptation for different media (video, text, audio)

3. Co-creation and Production of Scientific Content for the Community: science communication workshops in schools and community spaces; production of teaching materials on technology and computing for diverse audiences; planning and execution of educational campaigns on topics such as digital privacy, artificial intelligence, and the social impact of computing

4. Use of Digital Technologies for Science Communication: tools for producing videos, podcasts, and infographics; strategies for boosting content on social media; monitoring and analysis of the impact of outreach initiatives

5. Impact Assessment and Critical Reflection on Science Communication: collection of feedback from the community served; reflection on transforming academic knowledge into accessible information; records of good practices and systematization of lessons learned

6. **Community Profile:** The course BCC292 - Science Communication aims to bring the university closer to society through accessible communication of scientific and technological knowledge. Its target audience includes schools, non-governmental organizations (NGOs), cultural collectives, entrepreneurs, teachers, and communities with limited access to scientific information. Students will act as knowledge mediators, turning computer science concepts into content that is understandable and applicable to the daily life of the population. Interaction with the community will be participatory and dialogic, ensuring that the topics addressed in the course are defined based on the interests and needs of society. In this way, the course contributes to the democratization of knowledge and to the strengthening of digital and scientific inclusion.

7. **Extension Objectives:** The course aims to (i) promote the democratization of scientific and technological knowledge, making computing accessible to diverse audiences through science communication strategies, (ii) foster dialogic interaction between the university and the community, allowing the topics addressed in the course to be built collectively based on social demands, (iii) train students to communicate scientific concepts in an accessible way, developing writing and speaking skills and the use of technologies to popularize science, (iv) encourage the production of educational content by promoting workshops, digital materials, and informational campaigns on relevant computing topics, and (v) assess the impact of science communication on the community, ensuring that the actions carried out have a concrete effect on the dissemination of knowledge and on social engagement.

Initial value problems for ordinary differential equations. Boundary value problems for ordinary differential equations. Numerical solutions for partial differential equations.

Course Content:

1. Initial value problems for ordinary differential equations: introduction to initial value problems; Euler's method; higher-order Taylor methods; Runge-Kutta methods; multistep methods; variable-step-size multistep methods; higher-order equations and systems of differential equations; application examples

2. Boundary value problems for ordinary differential equations: introduction to boundary value problems; linear shooting method; shooting method for nonlinear problems; finite difference method for linear problems; finite difference method for nonlinear problems; application examples

3. Numerical solutions for partial differential equations: introduction to partial differential equations; elliptic partial differential equations; parabolic partial differential equations; hyperbolic partial differential equations; application examples

COURSE PROGRAM

Course Name in English: **Logics in Computer Science** Course Name in Portuguese: **Lógica Aplicada à Computação**			Code: **BCC295**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

First-order logic, the DPLL algorithm, and the use of SAT and SMT solvers. Intuitionistic logic and type theory. Use of proof assistants. Induction and co-induction and their use in program verification. Temporal logic and model checking.

Course Content:

1. Course presentation: motivation and evaluation criteria
2. Review of propositional logic: syntax, semantics, and natural deduction
3. Review of predicate logic: syntax, semantics, and natural deduction
4. The SAT problem and the DPLL algorithm
5. Modeling problems using SAT and using SAT solvers
6. Satisfiability Modulo Theories (SMT) and the DPLL-T algorithm
7. Modeling problems using SMT and SMT solvers
8. Intuitionistic logic and typed lambda calculus: the Curry-Howard isomorphism
9. Introduction to the use of type-theory-based proof assistants
10. Review: mathematical induction, proofs by structural induction
11. Induction over well-founded relations
12. Proofs by co-induction; use of co-induction in proof assistants
13. Temporal logic and model checking

Course Description:

Overview and history of operating systems; operating system principles; process management; use of thread APIs (Application Programming Interface); memory management; device management; security and protection; file systems.

Course Content:

1. Introduction: definition, history, basic concepts, system calls, and structure
2. Processes and Threads: inter-process communication (IPC), scheduling, and deadlocks
3. Memory management: swapping, virtual memory, replacement algorithms, and segmentation
4. Input/Output: disks, clocks, networks, and terminals
5. File Systems: directories, file system implementation, and examples
6. Network security: basic concepts of cryptography, authentication, attacks, and protection mechanisms
7. Case Studies: overview, processes, memory management, I/O, file system, and security

Course Description:

Markup languages and style sheets; Front-end development topics; Server-side programming; How browsers work; Libraries and frameworks for Web application development.

Course Content:

1. Markup languages and style sheets: HTML (basic concepts and best practices, semantic web, responsiveness); CSS (basic concepts and best practices, block vs inline, selectors, box model, flexbox, position, responsiveness, animations)
2. Front-end development topics: basic scripting language concepts, Document Object Model (DOM), events, browser extensions, asynchronous events (fetch API, Promise), JSON
3. Server-side programming: HTTP requests, CORS, routes, databases, authentication
4. How browsers work: history, design principles
5. Libraries and frameworks for Web application development

COURSE PROGRAM

Course Name in English: **Design and Analysis of Computational Experiments** Course Name in Portuguese: **Projeto e Análise de Experimentos Computacionais**			Code: **BCC408**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 2 class hours	Practical 2 class hours

Course Description:

Review of statistical concepts; simple comparative experiments, statistical inference and hypothesis testing; single-factor experiments, analysis of variance, factorial models; definition of parameters of optimization methods; computational benchmarking; performance analysis of heuristic methods; comparison of heuristics or randomized methods; computational tools for statistical testing.

Course Content:

1. The strategy of experimentation
2. Practical guidelines for designing an experiment
3. A brief history of designed experiments
4. Review: using statistical techniques in experiments
5. Review of some basic statistical concepts and methods (mode, median, quartiles, variance, standard deviation, range, interquartile range, coefficient of variation, histogram)
6. Computational benchmarking
7. Definition of parameters of optimization methods
8. Performance analysis of heuristic methods
9. Graphical representations: time-to-target plots and boxplots
10. Pseudoreplication
11. Comparison of heuristics and randomized methods
12. Random samples, statistics and sampling distributions
13. Statistical intervals and hypothesis tests
14. Computational tools for statistical testing
15. Simple comparative experiments

16. Statistical methods for comparing the means of two populations
17. Parameter estimation and confidence intervals
18. Statistical hypothesis tests on the difference of means
19. Single-factor experiments: design issues and analysis of variance
20. How to report the analysis of statistical tests

Course Description:

Introduction to evolutionary computing; evolution by natural selection; basic concepts and components of evolutionary algorithms; genetic algorithms; evolution strategies; evolutionary programming; genetic programming; classifier systems; hybrid algorithms; constraint handling; multi-objective optimization with evolutionary algorithms.

Course Content:

1. Introduction to evolutionary computing and its relation to biological models
2. Basic components common to evolutionary algorithms
3. Categories of evolutionary algorithms
4. Evolutionary systems applied to classification systems
5. Hybrid algorithms
6. Introduction to multi-objective optimization

Course Description:

Basic concepts of graphs; network flow models; shortest path, maximum flow, and minimum-cost flow algorithms; applications and implementation of specialized algorithms.

Course Content:

1. Basic graph concepts: notation and definitions; network representation; examples of network models
2. Shortest path problems: introduction; applications; solution algorithms and implementations
3. Maximum flow problem: introduction; applications; flows and cuts; max-flow min-cut theorem; solution algorithms and implementations
4. Minimum-cost flow problems: introduction; applications; solution algorithms and implementations
5. Applications: assignment problems; matching problems; routing problems; sequencing problems

Course Description:

Linear programming modeling. Simplex algorithm. Duality. Sensitivity analysis. Column generation. Dantzig-Wolfe decomposition methods. Integer programming modeling. Implicit enumeration. Cutting planes. Bounds and relaxations.

Course Content:

1. Introduction to Linear Programming (History)
2. Modeling simple problems
3. Graphical method
4. Problem modeling and example applications
5. MathProg modeling language
6. Simplex Algorithm
7. Duality
8. Sensitivity analysis
9. Column generation
10. Dantzig-Wolfe decomposition
11. Integer Programming modeling
12. Evaluating Formulation Quality
13. Generation of valid inequalities and automatic reformulation
14. Techniques for generating strong dual and primal bounds
15. Column generation in Integer Programming

Course Description:

Mathematical foundations; basic concepts of nonlinear optimization; optimality conditions; unconstrained and constrained minimization methods; objective functionals and objective vectors; ordered sets; Pareto solutions: analytical characterization; generation of Pareto solutions; preference indication; algorithms for multi-objective optimization; multi-objective optimization with evolutionary algorithms; decision making.

Course Content:

1. Course plan presentation and introduction: The vector optimization problem; Notation
2. Ordering of solutions: Pareto-optimal set; locally Pareto-optimal set; utopian solution
3. The problem of determining efficient solutions: Kuhn-Tucker conditions for efficiency
4. Generation of efficient solutions: Weighted-sum approach; Epsilon-constraint approach; goal-programming approach; efficiency test
5. Structure of the Pareto-optimal set
6. Multi-objective Analysis: Consistency; ordering and dominance; extension
7. Multi-objective Decision and Synthesis
8. Multi-objective Genetic Algorithms: Construction of Multi-objective Genetic Algorithms

Course Description:

Combinatorial optimization problems. Classical heuristics. Local search. Multi-start methods. Trajectory-based metaheuristics. Population-based metaheuristics. Nature-inspired methods. Applications.

Course Content:

1. Introduction: combinatorial optimization problems
2. Greedy algorithms
3. Local search
4. Large neighborhood search
5. Path relinking
6. Simulated Annealing
7. Tabu Search
8. Iterated local search
9. Variable neighborhood search
10. Multi-start procedures
11. Nature-inspired algorithms
12. Evolutionary algorithms
13. Scatter Search
14. Applications in routing
15. Applications in sequencing

Course Description:

Software project management, software process, software life cycle, project management according to PMI-PMBOK, agile project management (SCRUM), management tools.

Course Content:

1. Software Project Management: Project Management; Software Project Management; Software Engineering and Project Management; project management process; traditional and agile management
2. Software Process: Process; software development processes; life cycle
3. Software: What is software; software as a product
4. PMI: What is PMI; process groups; knowledge areas; projects; integration management; scope management; time management; cost management; quality management; human resources management; communications management; risk management; procurement management; stakeholder management
5. SCRUM: Definition; SCRUM model; roles; artifacts; meetings
6. Tools: Tools supporting the various activities and practices of project management in traditional and agile approaches

Course Description:

What is quality. Software processes. Process quality. Product quality. MPS-BR (Software and service development). CMMI. Metrics. Testing. Verification. Validation. Auditing.

Course Content:

1. What is Quality: Quality; Software Quality; Process Quality
2. Process Quality: What is a process and a software process; process maturity; norms and standards; process improvement
3. Product Quality: What is a product and a software product; norms and standards
4. MPS-BR: Software Development; Service
5. CMMI
6. Quality monitoring and control: Metrics; Testing; Verification; Validation; Auditing

Basic Bibliography:

COURSE PROGRAM

Course Name in English: **Interaction Design** Course Name in Portuguese: **Design de Interação**			Code: **BCC555**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

The Interaction Design process; requirements gathering; task modeling and interaction modeling; prototyping and construction; notions of Visual Design.

Course Content:

1. The Interaction Design Process: Examples of good and bad designs; What is Interaction Design; Usability goals and user experience goals; Conceptual Models; Interface Metaphors; Interaction Paradigms; Life cycle models for Interaction Design; Life cycle models in Software Engineering; Integration of Software Engineering and HCI Models

2. Requirements Gathering: Functional and Non-Functional Requirements; Questionnaires; Interviews; Focus Groups; Card Sorting; Brainstorming; Contextual Inquiry

3. Task and Interaction Modeling: Abstract representations of interface/interaction; user profiles; personas and goals; storyboards; analysis scenarios; interaction scenarios; use cases; hierarchical task analysis; interaction diagrams; MoLIC

4. Prototyping and Construction: Paper prototypes; low-fidelity prototypes; high-fidelity prototypes; prototyping tools; Conceptual Design: from requirements to the first design; Physical Design

5. Notions of Visual Design: Icon design; layout design; color design; typography design

Basic Bibliography:

- Jennifer Preece, Yvonne Rogers e Helen Sharp; tradução de Viviane Possamai. Design de interação: além da interação homem-computador. Porto Alegre, RS: Bookman, 2005.

COURSE PROGRAM

Course Name in English: **Design of Integrated Logic Circuits Using HDL (Hardware Description Language)** Course Name in Portuguese: **Projeto de Circuitos Lógicos Integrados usando HDL (Hardware Description Language)**			Code: **BCC568**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 1 class hours	Practical 3 class hours

Course Description:

Overview of the Digital Integrated Circuit Design flow and its importance for the country's economic development. Concepts and applicability of application-specific integrated circuits (ASICs). Main hardware description languages (HDLs). Integrated Circuit Design techniques. Use of HDL for integrated circuit design.

Course Content:

1. Introduction: digital integrated circuit design flow (architecture, design, verification, logic synthesis, and physical synthesis)
2. Introduction to FPGA (gate arrays, capacity, Look-Up Tables - LUTs)
3. Digital Integrated Circuit Architecture (processors, communication buses for System-on-Chip - SoC, peripherals, and memory access)
4. Hardware Description Language: Verilog 2001
5. Description of basic combinational and sequential digital integrated circuits (logic gates, half adder, full adder, multiplexers and demultiplexers, encoders and decoders, counters, registers and flip-flops) using Verilog 2001
6. CISC Architecture and RISC Architecture
7. Integrated circuit design projects using HDL

Basic Bibliography:

Course Description:

Fundamentals of Cloud Computing: terminology and concepts; virtualization; elasticity, resilience, on-demand and metered use; benefits, challenges, and risks of platforms and services; administration and governance; Software as a Service (SaaS), Platform as a Service (PaaS), and Infrastructure as a Service (IaaS) Cloud Delivery Models; Service Level Agreements (SLAs) for Cloud-based IT Resources.

Course Content:

1. Fundamentals of Cloud Computing: terminology and concepts
2. Virtualization: XEN, QEMU, Eucalyptus, Private Cloud
3. Elasticity, Resilience, On-Demand, and Metered Use
4. Software as a Service (SaaS), Platform as a Service (PaaS), and Infrastructure as a Service (IaaS) Cloud Delivery
5. Benefits, challenges, and risks of platforms and services
6. Creating a Cloud solution: Ruby on Rails as PaaS; Software-Defined Routing as IaaS; SOA as SaaS
7. Administration and Governance
8. Service Level Agreements (SLAs) for Cloud-based IT Resources
9. Performance analysis

Course Description:

Network, system, and information security, cybersecurity. Cryptography. Digital signatures, digital certificates, attribute certificates. Network security. Cryptographic media: biometric identifiers. Cybersecurity and impacts on contemporary society.

Course Content:

1. Introduction to security: information security, network security, system security, and cybersecurity
2. Symmetric and asymmetric cryptography
3. Cryptographic algorithms
4. Digital signatures: digital certificates and the PKI (ICP) standard
5. ICP-Brasil and ICP-Edu
6. Network security: monitoring and network intrusion
7. Principles of hacking
8. Cryptographic media and biometric identifiers
9. ISO27000
10. ITIL and COBIT within the information security context
11. IISP certifications, among others
12. Cybersecurity and impacts on contemporary society

COURSE PROGRAM

Course Name in English: **Embedded Systems** Course Name in Portuguese: **Sistemas Embutidos**			Code: **BCC585**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 2 class hours	Practical 2 class hours

Course Description:

Fixed-point and floating-point integer arithmetic. Computer and microcontroller architecture. Microcontroller programming in C and Assembly. Input and output concepts for microcontrollers. Use of finite-state machines to solve programming problems. Programming applications with keypads, liquid crystal and seven-segment displays, interfacing with actuators (motors). Analog-to-digital (ADC) and digital-to-analog (DAC) converters. Interrupt and Timer concepts. Data transmission. Embedded Systems Design.

Course Content:

1. Course plan presentation and Introduction: what is an embedded system, types of embedded systems
2. Numerical representation: integer, fixed-point, floating-point
3. C language and tools: compiler, linker, loader
4. Review of computer architecture and introduction to microcontroller architecture: architecture, instruction set, programming, Assembly for microcontrollers
5. Basic Input/Output interfacing: buttons, LEDs, displays, segments, LCD; basic input/output interfacing with actuators (DC motor, stepper motor, servo motor); analog interfacing (ADC, DAC, PWM)
6. Interrupts and Timers: concept, programming, resource-sharing issues
7. Serial Communication: RS232, I2C, SPI, CAN
8. Embedded systems design: modeling methodology, finite-state machines, software development cycle, data flow diagrams, statecharts

COURSE PROGRAM

UFOP
Universidade Federal de Ouro Preto

Course Name in English: **Geoprocessing and Geographic Information Systems** Course Name in Portuguese: **Geoprocessamento e Sistemas de Informação Geográfica**			Code: **BCC593**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

Computational representations of geographic space; introduction to cartography for geoinformatics; introduction to Geographic Information Systems; introduction to numerical terrain modeling; introduction to the global positioning system; introduction to remote sensing; introduction to Geographic Database modeling; introduction to Geographic Data Analysis; applications in Geoinformatics.

Course Content:

1. Computational representations of geographic space: mathematical-computational modeling concepts, time, space, scale (extent and resolution) and processes of change; conceptual field and object models; raster data structures (numerical grids and images) and vector data structures (points, lines, and polygons)

2. Introduction to Cartography for Geoinformatics: datum, cartographic projections, geographic coordinate systems, standardized geographic reference systems, cartographic scale

3. Introduction to Geographic Information Systems: architecture (dual and integrated), typology (desktop, client-server, web), use of free tools (TerraView and QGIS); data layers, views, themes, and legends; vector and raster data acquisition; interoperability (DXF, SHP, GML); alphanumeric and spatial queries

4. Introduction to Remote Sensing: concepts of satellites and remote sensors; types of imagery (optical, radar, and thermal); bands and false-color composition (RGB); image registration and georeferencing; digital image processing techniques (contrast, resampling, filtering, segmentation, and classification)

5. Introduction to Geographic Database Modeling: OMT-G notation; implementation of geographic databases using free tools; spatial queries (reports) in free tools; spatial data indexing (Quadtree and R-tree)

6. Introduction to Numerical Terrain Modeling: digital elevation model (DEM) and triangulated irregular networks (TIN); construction of digital terrain models from contour lines, drainage lines, and ridge lines

7. Introduction to the Global Positioning System: GPS and Galileo systems; calibration and use of GPS equipment; sources of error and lack of precision; types of GPS equipment (navigation, mapping, differential)

8. Introduction to Geographic Data Analysis: spatial analysis (point and area data), geostatistics (ordinary kriging), and map algebra (Tomlin and Egenhofer operators)

9. Applications in Geoinformatics: land use and land cover change, disease spread, and multipurpose technical cadastre

Course Description:

Introduction to computational modeling of geographic phenomena. Theoretical foundations of Earth system science. Concepts and computational representations of scale, space, time, and behavior. Introduction to spatially explicit dynamic models. Introduction to computational simulation. Introduction to Earth system modeling paradigms. Free tools for Earth system modeling. Multi-scale Earth system modeling. Applications in Earth system modeling and simulation. Mathematical methods applied to Earth system modeling.

Course Content:

1. Introduction to Computational Modeling of Geographic Phenomena
2. Theoretical foundations of Earth system science: mathematical-computational models, the modeling process, process simulation, energy stocks and flows, feedbacks, Earth system science
3. Spatially explicit dynamic models: definition, taxonomy, development methodology, verification, calibration, validation
4. Introduction to computational simulation: discrete simulation and discrete-event simulation, advantages and disadvantages, implementation of simulators
5. Concepts and computational representation of scale, space, time, and behavior
6. Earth system modeling paradigms: system dynamics, cellular automata, multi-agent systems
7. Free tools for environmental modeling: Vensim, NetLogo, Repast, TerraME
8. Multi-scale Earth system modeling: software requirements, integration with geographic information systems, development platforms
9. Applications: hydrological models, climate models, population dynamics models, land use and land cover change models, species dispersal models, atmospheric models, epidemiological models, econometric models
10. Mathematical methods applied to Earth system modeling: statistical inference, probability, and spatial analysis

Course Description:

Modeling of information retrieval systems. Characterization of the web. Operation of crawling systems. Distributed indexing. Query languages. Query operations. Generation of ranking functions. Evaluation of results.

Course Content:

1. Introduction
2. Boolean retrieval
3. Term vocabulary and inverted lists (postings)
4. Dictionaries and tolerant retrieval
5. Index construction
6. Index compression
7. Scoring, term weighting, and the vector space model
8. Computing scores in a complete search system
9. Evaluation in information retrieval
10. Relevance feedback and query expansion
11. Introduction to Web search
12. Web crawling and indexing
13. Link analysis

Course Description:

Characterization of Web data; modeling of semi-structured data; query languages; extraction of Web data; integration of Web data; applications.

Course Content:

1. Web data: characteristics of Web data, Web versus databases, architecture of Web applications
2. Modeling semi-structured data and XML: characteristics of semi-structured data, models for representing semi-structured data, XML, relational representation of XML data, publishing relational data as XML, XML structure discovery, tools for XML data management, XML data compression
3. Query languages: query languages for the Web, query languages for semi-structured data, XML query and manipulation languages
4. Extracting data from Web sources: characterization of the problem, main approaches, tools, evaluation of extraction quality
5. Web data integration: characterization of the integration problem, approaches and architectures, data fusion, similarity measures
6. Advanced topics: query processing on XML documents, hidden Web data access, entity recognition and extraction, the Semantic Web, the Web of Data, Web page crawling, digital libraries

Course Name in English: **Real-Time Software Design** Course Name in Portuguese: **Projeto de Software de Tempo Real**			Code: **BCC822**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 2 class hours	Practical 2 class hours

Course Description:

Introduction to Operating Systems. Basic Operating System concepts. Introduction to Real-Time Operating Systems. Classification of Operating Systems. Concurrency. Scheduling for Operating Systems. Scheduling for Real-Time Operating Systems. Synchronization objects and Critical Section. Inter-task Communication. Time Management. Formal methods for Real Time: modeling, languages, verification. Development of real-time systems.

Course Content:

1. Operating System Concepts: characteristics of operating systems, processes, tasks, schedulers, scheduling policies, synchronization between tasks/processes, task and process states
2. Introduction to Real-Time Operating Systems: definitions and characteristics; motivation for real-time operating systems; periodic and aperiodic tasks (arrival time, ready time, execution time, period, deadline); priorities; classification (Hard and Soft RTOS); volatile and static global variables; preemptive and non-preemptive; real-time interrupts and exceptions; real-time task states; task control block (TCB); performance measures
3. Concurrent Systems: concepts and problems
4. Real-Time System Scheduling Policies
5. Synchronization Objects and Critical Section
6. Task Synchronization: busy waiting, semaphores, mutexes, deadlock
7. Inter-task Communication: shared memory, message passing
8. Real-Time Communication: architecture, access methods, real-time protocols
9. Formal Methods for Real Time: modeling, language, verification
10. Development of real-time systems

COURSE PROGRAM

Course Name in English: **Adversarial Machine Learning** Course Name in Portuguese: **Aprendizado de Máquina Adversarial**			Code: **BCC881**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

Study of the security of machine learning systems against intentional manipulation by adversaries. The course examines how attackers can deceive models at deployment time, corrupt them during training, or extract information about the models and the data they were trained on, and how these threats can be formally described. It covers the principles behind defenses, the methodology needed to assess their real effectiveness, and the limits of current guarantees, considering the constraints of different application domains.

Course Content:

1. Foundations of Adversarial ML Security: vulnerabilities across the ML pipeline, security goals, threat models, training-time and inference-time attack surfaces, taxonomy of attacks, overview of defense strategies
2. Evasion Attacks
3. Data Poisoning and Backdoor Attacks
4. Model Inference and Privacy Attacks
5. Robust Defense Mechanisms
6. Evaluating Model Robustness
7. Adversarial Machine Learning in Specific Domains

Course Description:

Introduction to the concepts, architectures, and technologies of the Internet of Things (IoT). Communication protocols, sensors, actuators, security, and intelligent applications in connected environments.

Course Content:

1. Fundamentals of the Internet of Things: definitions, evolution, and current landscape
2. IoT architecture: layers, devices, and embedded systems
3. Sensors and actuators: types, operation, and integration
4. IoT communication protocols
5. Platforms and tools for IoT development
6. Security and privacy in IoT environments
7. Data collection, transmission, and processing in IoT
8. Integration with artificial intelligence and cloud computing
9. Use cases: smart cities, precision agriculture, healthcare, and Industry 4.0

Course Description:

Regular languages, regular expressions, finite-state automata. Context-free languages and grammars, pushdown automata. Context-sensitive languages and grammars. Turing machines. The Church-Turing thesis. Computability and decidability. The Chomsky hierarchy.

Course Content:

1. Introduction: alphabets, strings, and languages
2. Deterministic and Nondeterministic Finite-State Automata
3. Regular Expressions
4. Minimization of Finite Automata
5. Properties of Regular Languages
6. Pumping Lemma for Regular Languages (RLs)
7. Context-Free Grammars and Languages (CFLs)
8. Ambiguity
9. Properties of CFLs
10. Pushdown Automata
11. Chomsky Normal Form
12. Regular Grammars and Context-Sensitive Grammars
13. Pumping Lemma for CFLs
14. Turing Machines
15. The Church-Turing Thesis
16. Decision Problems

17. Undecidability of the Halting Problem

18. Decidable and undecidable problems about languages

Course Description:

User interface and interaction. Quality in HCI. Theoretical approaches in HCI. Introduction to the interactive systems design process. Introduction to the interactive systems evaluation process.

Course Content:

1. User Interface and Interaction: concept of interface and interaction, importance of the HCI field in software development, history, HCI as a multidisciplinary field, benefits of HCI, interaction problems
2. Quality in HCI: usability, communicability, accessibility, user experience
3. Theoretical Approaches in HCI: experimental psychology (Hick-Hyman Law and Fitts's Law), cognitive engineering, semiotic engineering
4. Introduction to the Interactive Systems Design Process: task modeling, interaction modeling, prototyping, principles and guidelines for HCI design, interaction styles
5. Introduction to the Interactive Systems Evaluation Process: HCI evaluation planning, inspection-based evaluation, user testing

Course Description:

Graphics systems; interactive graphics programming; modeling of three-dimensional objects and scenes; geometric transformations; viewing; lighting and shading; transparency and opacity; texture mapping; clipping; hidden surface removal; rasterization.

Course Content:

1. Graphics systems
2. Input and output devices
3. Graphics system architecture
4. Color
5. Graphics programming: application programmer interface, primitives and attributes, interactive techniques
6. Modeling of three-dimensional objects and scenes: elementary geometric objects, operations on geometric data, three-dimensional primitives, coordinate systems, object modeling
7. Data structures
8. Affine transformations
9. Object movement
10. Viewing: positioning the observer relative to the scene, viewing transformation, projection types, projection transformation
11. Lighting and shading: interaction between light and surfaces, light sources, Phong reflection model, shading of polygonal surfaces, transparency, texture mapping
12. Clipping: of line segments, of polygons, of other primitives
13. Hidden surface removal: back-face culling
14. Z-buffer sorting algorithm: depth sorting

15. Rasterization: of line segments, of polygons

16. Aliasing

Course Description:

Study of user interface (UI) and user experience (UX) design principles applied to Artificial Intelligence systems. Focus on usability, accessibility, human-machine interaction, and the evaluation of intelligent interfaces.

Course Content:

1. Fundamentals of UI and UX: concepts, history, and importance
2. Principles of user-centered design
3. UX specifics for AI-based systems: transparency, trust, and user control
4. Prototyping and wireframing techniques for intelligent interfaces
5. Human-AI interaction: conversation design, chatbots, and virtual assistants
6. Usability evaluation: qualitative and quantitative methods
7. Digital accessibility and inclusion in intelligent systems
8. Ethical challenges in UI/UX for AI: bias, privacy, and explainability
9. Tools and frameworks for UI/UX development in AI
10. Case studies: real-world applications in AI and intelligent interfaces

COURSE PROGRAM

Course Name in English: **Computability** Course Name in Portuguese: **Computabilidade**			Code: **BCC983**
Department Name and Acronym: Department of Computer Science (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 4 class hours	Practical 0 class hours

Course Description:

Formal models of computation and the notion of a computable function. Deterministic, non-deterministic and universal Turing machines. Decidability and undecidability: the halting problem, reductions and Rice's Theorem. Time complexity: the classes P, NP, coNP and EXP; NP-completeness and the Cook-Levin Theorem. Space complexity: the classes L, NL and PSPACE; the Savitch and Immerman-Szelepcsényi theorems. Randomized complexity: the classes BPP, RP and ZPP. Interactive proofs: the classes IP, MIP and PCP and zero-knowledge proofs. Major open questions in computational complexity theory.

Course Content:

1. Introduction and motivation: what computability is and why we classify problems by difficulty; review of asymptotic notation; the major open questions of the field (P vs. NP).
2. Non-computable functions and countability: countable and uncountable sets; Cantor's diagonal argument.
3. Deterministic Turing machines: formal definition, configurations, computations and input encoding; languages decided and recognized.
4. Construction of Turing machines and programming techniques (multiple tapes, markers, subroutines); variants and their equivalence.
5. Equivalence between models of computation and the Church-Turing Thesis.
6. Universal Turing machines and the encoding of machines as strings.
7. The halting problem and (many-one) reductions.
8. The classes R, RE and coRE; enumerators, hierarchies and languages outside RE.
9. Rice's Theorem and the undecidability of semantic properties of programs.
10. The Busy Beaver function and Kolmogorov complexity.
11. Time classes P and EXP; the time hierarchy theorem.

12. Problems in NP: SAT, CLIQUE and integer programming; polynomial-time verifiers and certificates.
13. Definition of NP via verifiers and via non-deterministic machines; the class coNP.
14. Polynomial-time reductions and NP-completeness.
15. The Cook-Levin Theorem and the reduction from SAT to 3-SAT.
16. Classic NP-complete problems and reduction techniques using gadgets.
17. Further NP-complete problems and applications: approximation algorithms and heuristics.
18. Space classes: L, NL, PSPACE and NPSPACE.
19. Savitch's Theorem and PSPACE-completeness (TQBF).
20. NL-completeness and the Immerman-Szelepcsényi Theorem (NL = coNL).
21. Randomized algorithms and the class BPP; primality testing and polynomial identity testing.
22. The classes RP, coRP and ZPP; error-probability amplification.
23. Pseudorandom generators and derandomization.
24. Interactive proof systems and the class IP.
25. The IP = PSPACE theorem and the arithmetization of Boolean formulas.
26. Zero-knowledge proofs and applications in cryptography.
27. Multi-prover proofs: the classes MIP and MIP*; the result MIP* = RE.
28. PCPs and the PCP Theorem; consequences for inapproximability.
29. General review and open questions: P vs. NP, NP vs. coNP, L vs. P and the derandomization of BPP.

FEDERAL UNIVERSITY OF OURO PRETO
DEAN'S OFFICE FOR UNDERGRADUATE STUDIES

COURSE PROGRAM

Course Name in English: **Intelligent Robotics** Course Name in Portuguese: **Robótica Inteligente**			Code: **BCC989**
Department Name and Acronym: Departamento de Computação (DECOM)			Academic Unit: ICEB
Delivery Mode: [X] in person [ ] blended [ ] distance learning			
Semester workload		Weekly workload	
Total 60 hours	Extension 0 hours	Theoretical 2 class hours	Practical 2 class hours

Course Description:

Introdução à robótica inteligente. Visão computacional aplicada à percepção de robôs. Aprendizado de máquina em robótica: aprendizado supervisionado e por reforço aplicados à percepção e ao controle. Modelos de linguagem na especificação de tarefas e no controle de robôs. Coordenação de sistemas multirrobôs. Interação humano-robô e robótica social. Aspectos éticos e sociais do uso de robôs.

Course Content:

1. Introdução à robótica inteligente
2. Visão computacional na robótica.
3. Aprendizado de máquina em robótica: aprendizado supervisionado e por reforço aplicados à percepção e ao controle.
4. Uso de modelos de linguagem na especificação de tarefas e no controle de robôs.
5. Sistemas multirrobôs.
6. Interação humano-robô e robótica social.
7. Aspectos éticos e sociais: privacidade, uso de imagem, segurança e responsabilidade no uso de robôs.
